# Machine Learning for the Detection of Network Attacks

Analyse the machine learning algorithms on the [CICIDS 2017 Dataset] for clasification of network attacks. (https://www.unb.ca/cic/datasets/ids-2017.html):

- Support Vector Machine (SVM)
- Decision Tree
- Naive Bayes
- K Means Clustering
- K Nearest Neighbours

## Import required libraries.

```
In [1]:
         import glob
         import matplotlib.pyplot as plt
         import numpy as np
         import pandas as pd
         import seaborn as sn
         import time
         from numpy import array
         from sklearn import preprocessing
         from sklearn.preprocessing import StandardScaler
         from sklearn.preprocessing import MinMaxScaler
         from sklearn.preprocessing import RobustScaler
         from sklearn.tree import DecisionTreeClassifier
         from sklearn.svm import LinearSVC
         from sklearn.naive bayes import MultinomialNB
         from sklearn.neighbors import NearestNeighbors
         from sklearn.neighbors import KNeighborsClassifier

         from sklearn.decomposition import PCA
         from sklearn.ensemble import RandomForestRegressor
         from sklearn.ensemble import RandomForestClassifier
         from sklearn.feature selection import SelectKBest
         from sklearn.feature_selection import chi2
         from sklearn.feature selection import mutual info classif
         from sklearn import metrics
         from sklearn.metrics import accuracy score
         from sklearn.metrics import confusion matrix
         from sklearn.metrics import precision recall fscore support as score
         from sklearn.metrics import completeness score, homogeneity score, v measure score
         from sklearn.model selection import train test split
```

## Loading the dataset

The implemented attacks include Brute Force FTP, Brute Force SSH, DoS, Heartbleed, Web Attack, Infiltration, Botnet and DDoS.

Datasets is available in 8 different csv files.

- Monday-WorkingHours.pcap\_ISCX.csv
- Tuesday-WorkingHours.pcap\_ISCX.csv
- Wednesday-workingHours.pcap\_ISCX.csv
- Thursday-WorkingHours-Morning-WebAttacks.pcap\_ISCX.csv
- Thursday-WorkingHours-Afternoon-Infilteration.pcap\_ISCX.csv
- Friday-WorkingHours-Morning.pcap\_ISCX.csv
- Friday-WorkingHours-Afternoon-PortScan.pcap\_ISCX.csv
- Friday-WorkingHours-Afternoon-DDos.pcap\_ISCX.csv

8 different csv files of cicids dataset needs to be concatenated into a single csv file.

```
In [2]:
         # # path to the all 8 files of CICIDS dataset.
         # path = './datasets'
         # all files = glob.glob(path + "/*.csv")
         # # concatenate the 8 files into 1.
         # dataset = pd.concat((pd.read csv(f) for f in all files))
In [3]:
         # # saving the combined dataset to disk named cicids.csv
         # dataset.to csv('cicids')
In [4]:
         dataset=pd.read_csv('cicids.csv')
In [5]:
         # Dimenions of dataset.
         print(dataset.shape)
         (2827876, 79)

Total number of all attack classes : 12
Total number of attack categories : 7
```

## Splitting the dataset

Splitting dataset in 60:20:20 ratio, for training, testing and validation dataset. By stratifying with y label proportions of attacks remain the same throughout the 3 sets.

```
In [23]: # 3 Different labeling options
    attacks = ['Label', 'Label_Category', 'Attack']

# xs=feature vectors, ys=labels
    xs = dataset.drop(attacks, axis=1)
    ys = dataset[attacks]

# split dataset - stratified
    x_train, x_test, y_train, y_test = train_test_split(xs, ys, test_size=0.3, random_state)
```

# Removing the columns with single unique values as it has no contribution in classification

```
'Fwd_Avg_Bytes_Bulk',
'Fwd_Avg_Packets_Bulk',
'Fwd_Avg_Bulk_Rate',
'Bwd_Avg_Bytes_Bulk',
'Bwd_Avg_Packets_Bulk',
'Bwd_Avg_Bulk_Rate']

In [25]: x_train = x_train.drop(to_drop, axis=1)
x_test = x_test.drop(to_drop, axis=1)
dataset_copy = dataset.drop(to_drop, axis=1)

In [26]: x_train.shape

Out[26]: (1979465, 69)
```

### **Data Normalization**

Min-max normalization technique is used to normalize the numerical values in dataset.

```
In [27]: # Normalise
min_max_scaler = MinMaxScaler().fit(x_train)

# Apply normalisation to dataset
x_train = min_max_scaler.transform(x_train)
x_test = min_max_scaler.transform(x_test)
```

### **Feature Selection**

Selecting K-best features by using chi2 scoring function for features

Number of features selected: 40

# Applying Machine Learning classifier models

Each machine learning algorithm is applied in three different categories:

- 1. On all attack labels (12).
- 2. Binary Classifier (2).
- 3. Multi-class Classifier (7).

And then evaluate performance of each algorithm by confusion matrix plot. Evaluate Accuracy, Precision, Recall, F1-score.

### 2. Decision Tree

```
In [33]: classifier = DecisionTreeClassifier(random_state = 0)
```

1. a) On all attack labels.

```
In [34]: # fit the model

start = time.time()
classifier.fit(x_train, y_train.Label)
end = time.time()
training_time = end - start

print("Model Training Time is : ", training_time)
